

# Molar Heat of Reaction

Textbook, p. 195

1. a)  $\text{HClO}_{3(s)} \rightarrow \text{H}^+_{(aq)} + \text{ClO}_3^-_{(aq)}$  Exothermic
- b)  $\text{HI}_{(g)} \rightarrow \text{H}^+_{(aq)} + \text{I}^-_{(aq)}$  Exothermic
- c)  $\text{KNO}_{3(s)} \rightarrow \text{K}^+_{(aq)} + \text{NO}_3^-_{(aq)}$  Endothermic
- d)  $\text{CuSO}_{4(s)} \rightarrow \text{Cu}^{2+}_{(aq)} + \text{SO}_4^{2-}_{(aq)}$  Exothermic
- e)  $\text{Li}_2\text{CO}_{3(s)} \rightarrow 2\text{Li}^+_{(aq)} + \text{CO}_3^{2-}_{(aq)}$  Exothermic

p. 195.

# 2)  $\Delta H_d = ?$  KJ/mol

$$m_{H_2O} = 20g$$

$$\Delta H = 50^\circ C$$

$$m_{NaOH} = 4g$$

① Determine quantity of heat transferred to water

$$Q = mc\Delta T$$

$$Q = 20(4.18)(50)$$

$$Q = \underline{4180 J} \quad \leftarrow (+) \text{ value means heat absorbed}$$

② Since heat was absorbed by water than the dissolution of 4g of NaOH must have released this heat!

$$\Delta H_d = -Q$$

$$\underline{\Delta H_d = -4180 J}$$

③ To determine molar heat we must first determine how many moles of NaOH we are dealing with.

$$n = \frac{m}{M} \quad n = \frac{4g}{40g/mol} = \underline{0.1 \text{ mole}}$$

④ Determine heat involved for 1 mol of dissolution of NaOH

$$\begin{array}{r} -4180 J = 0.1 \text{ mol} \\ \times \quad \quad = 1 \text{ mole} \end{array}$$

$$\underline{x = -41800 J} \quad \leftarrow \text{for 1 mole}$$

$$\textcircled{5} \quad \Delta H_d = -41800 J/\text{mole}$$

$\div 1000$

$$\underline{\underline{\Delta H_d = -41.8 \text{ KJ/mol} \quad (\text{EXO})}}$$

#3)  $m_{\text{KClO}_3} = 24.42 \text{ g}$

$m_{\text{H}_2\text{O}} = 1 \text{ Kg} = 1000 \text{ g}$

$\Delta T = -2 \text{ }^\circ\text{C}$

$\Delta H_d = ? \text{ KJ/mol}$

① Determine Quantity of heat transferred to water

$$Q = mC\Delta T$$

$$Q = (1000)(4.18)(-2)$$

$$Q = \underline{-8368 \text{ J}} \leftarrow (-) \text{ value means heat released by water}$$

② Since heat was released by water than the dissolution of 24.42g of  $\text{KClO}_3$  must have absorbed this heat

$$\Delta H_d = -Q$$

$$\Delta H_d = -(-8368)$$

$$\Delta H_d = \underline{8368 \text{ J}}$$

③ To determine molar heat we must first determine how many moles of  $\text{KClO}_3$  we are dealing with.

$$\left( M_{\text{KClO}_3} = 122.5 \frac{\text{g}}{\text{mol}} \right) \quad n = \frac{m}{M} \quad n = \frac{24.42}{122.5} = \underline{0.199 \text{ moles}}$$

⑥ Write dissolution equation:

④ Determine heat involved for 1mole of dissolution of  $\text{KClO}_3$ .

$$0.199 \text{ moles} = 8368 \text{ J}$$

$$1 \text{ mole} = x$$

$$x = \underline{42050 \text{ J}} \leftarrow \text{for 1 mole}$$

⑤  $\Delta H_d = 42050 \text{ J/mol}$   
 $\div 1000$

$$\underline{\underline{\Delta H_d = 42 \text{ KJ/mol}}} \quad (\text{ENDO})$$

#11)

$$M_{\text{KOH}} = 250 \text{ mL}$$

$$M_{\text{HNO}_3} = 250 \text{ mL}$$

$$M_{\text{H}_2\text{O}} = 500 \text{ mL}$$

(from neutralization)

$$C_{\text{KOH}} = 0.5 \text{ mol/L}$$

$$C_{\text{HNO}_3} = 0.5 \text{ mol/L}$$

$$\left. \begin{array}{l} T_i = 23.5^\circ\text{C} \\ T_f = 27^\circ\text{C} \end{array} \right\} \Delta T = 3.5^\circ\text{C}$$

$$\Delta H_n = ? \text{ kJ/mole}$$

① Calculate heat transferred to/from water

$$Q = m C \Delta T$$

$$Q = 500(4.18)(3.5)$$

$$\underline{Q = 7315 \text{ J}}$$

← (+) value means heat absorbed by water

② Since heat was absorbed by water during neutralization, then the neutralization must have released this heat!

$$\Delta H_n = -Q$$

$$\underline{\Delta H_n = -7315 \text{ J}}$$

③ Since both the acid and the base have same volumes and concentrations we can use the info from either to calculate the number of moles we are dealing with.

$$C = \frac{n}{V} \quad 0.5 = \frac{n}{0.25 \text{ L}} \quad n = 0.125 \text{ moles}$$

④ Determine heat involved for 1 mole of acid or base in neutralization:

$$\begin{array}{l} 0.125 \text{ moles} = -7315 \text{ J} \\ 1 \text{ mole} = x \end{array}$$

$$\underline{x = -58520 \text{ J}} \quad \leftarrow \text{for 1 mole}$$

$$\textcircled{5} \quad \Delta H_n = \frac{-58520 \text{ J}}{1000} \text{ /mole}$$

$$\underline{\underline{\underline{\Delta H_n = -58.52 \text{ kJ/mol}}}}}$$

#5) Salt = ???

$$n = 1 \text{ mole}$$

$$m_{\text{H}_2\text{O}} = 1000 \text{ mL} = 1000 \text{ g}$$

$$\Delta T = -5.5^\circ\text{C}$$

(Refer to P. 420 of text)

① Determine quantity of heat transferred to/from water

$$Q = mc\Delta T$$

$$Q = 1000(4.18)(-5.5)$$

$$\underline{Q = -22990 \text{ J}} \leftarrow \begin{array}{l} (-) \text{ value} \\ \text{means heat} \\ \text{released} \end{array}$$

② Since heat was released by water than the dissolution of 1 mol of the salt must have absorbed heat.

$$\Delta H_d = -Q$$

$$\Delta H_d = -(-22990)$$

$$\underline{\underline{\Delta H_d = 22990 \text{ J}}}$$

③ Since 22990 J of heat was absorbed when 1 mole of salt was dissolved, then the molar heat of dissolution is:

$$\Delta H_d = 22990 \text{ J/mol}$$
$$\div 1000$$

$$\underline{\underline{\Delta H_d = 22.99 \text{ kJ/mole}}}$$

④ Refer to P. 420 of text:

$$\Delta H_d = 22.99 \text{ kJ/mol} = \underline{\underline{\text{AgNO}_3}}$$

Unknown salt  $\rightarrow$

#6) GET READY TO WORK!  
BACKWARDS.

$$m_{\text{CuSO}_4} = 8\text{g}$$

$$m_{\text{H}_2\text{O}} = 100\text{g}$$

$$T_i = 20^\circ\text{C}$$

$$T_f = ???$$

$$\Delta H_d = -68 \text{ kJ/mole} \leftarrow \begin{matrix} \text{TEXT} \\ \text{BOOK} \end{matrix}$$

(CuSO<sub>4</sub>)

$$M_{\text{CuSO}_4} = 159.6 \text{ g/mol}$$

① Refer to P.420 of text for  $\Delta H_d$  of CuSO<sub>4</sub>

$$\Delta H_d = -68 \text{ kJ/mol}$$

(CuSO<sub>4</sub>)

or

$$\Delta H_d = -68000 \text{ J/mol}$$

(CuSO<sub>4</sub>)

② Find # of moles of CuSO<sub>4</sub>

$$n = \frac{m}{M} \quad n = \frac{8}{159.6} \quad n = \underline{0.05 \text{ moles}}$$

③ Determine the heat released during the dissolution of 0.05 moles (8g) of CuSO<sub>4</sub>

$$1 \text{ mole} = -68000 \text{ J}$$

$$0.05 \text{ moles} = x$$

$$\underline{\underline{x = -3400 \text{ J}}} \leftarrow \begin{matrix} \text{heat} \\ \text{released} \\ \text{during} \\ \text{dissolution} \end{matrix}$$

④ If dissolution reaction released energy, then the surrounding water absorbed this heat.

$$-\Delta H_d \quad Q = -\Delta H_d$$

$$-(-3400) \quad Q = -(-3400)$$

$$\underline{\underline{Q = 3400 \text{ J}}} \leftarrow \begin{matrix} \text{energy} \\ \text{absorbed} \\ \text{by water.} \end{matrix}$$

⑤ Calculate temperature change ( $\Delta T$ ) of water

$$Q = mc\Delta T$$

$$3400 = 100(4.18)\Delta T$$

$$\frac{3400}{100(4.18)} = \Delta T$$

$$\underline{\underline{8.1^\circ\text{C} = \Delta T}}$$

⑥ Calculate temperature final of water

$$\Delta T = T_f - T_i$$

$$8.1 = T_f - 20$$

$$\underline{\underline{\underline{T_f = 28.1^\circ\text{C}}}}}$$

#8)

$$m_{\text{KOH}} = ???$$

$$m_{\text{H}_2\text{O}} = 100\text{g}$$

$$\left. \begin{array}{l} T_i = 25^\circ\text{C} \\ T_f = 80^\circ\text{C} \end{array} \right\} \Delta T = 55^\circ\text{C}$$

$$M_{\text{KOH}} = 56\text{g/mol}$$

- ① Determine Quantity of heat transferred to/from water

$$Q = mc\Delta T$$

$$Q = (100)(4.18)(55)$$

$$Q = \underline{22990\text{ J}}$$

← (+) value means heat absorbed.

- ② Since Water absorbed heat, then dissolution of KOH must have released heat.

$$\Delta H_d = -Q$$

$$\Delta H_d = \underline{-22990\text{ J}}$$

(however we still don't know how much KOH it took release this heat)

- ③ Refer to P. 420 of text for  $\Delta H_d$  of KOH.

$$\Delta H_d = -55\text{ kJ/mole}$$

(KOH)

or

$$\Delta H_d = \underline{-55000\text{ J/mole}}$$

(KOH)

- ④ Determine how many moles of KOH were used in our dissolution.

$$1\text{ mole} = -55000\text{ J}$$

$$x = -22990\text{ J}$$

$$x = \underline{0.42\text{ moles of KOH}}$$

- ⑤ Determine mass of KOH

$$n = \frac{m}{M} \quad 0.42 = \frac{m}{56}$$

$$\begin{array}{l} m = 56(0.42) \\ m = \underline{23.5\text{g}} \end{array}$$

#10)

$$C_{\text{NaNO}_3} = 0.1 \text{ mol/L}$$

$$V_{\text{NaNO}_3} = 2 \text{ L}$$

$$m_{\text{H}_2\text{O}} = 2 \text{ L} = 2000 \text{ g}$$

$$\Delta H_d_{\text{NaNO}_3} = 21 \text{ kJ/mole}$$

$$T_i = 24^\circ\text{C}$$

$$T_f = ???$$

① Determine # of moles of  $\text{NaNO}_3$

$$\begin{array}{l} 0.1 \text{ mole} = 1 \text{ L} \\ \times \\ x = 2 \text{ L} \end{array}$$

$$\underline{\underline{x = 0.2 \text{ moles of NaNO}_3}}$$

② Refer to P. 420 of text for molar heat of  $\text{NaNO}_3$

$$\Delta H_d_{\text{NaNO}_3} = 21 \text{ kJ/mole}$$

or

$$\Delta H_d_{\text{NaNO}_3} = 21000 \text{ J/mole}$$

③ Determine the heat for the dissolution of 0.2 moles of  $\text{NaNO}_3$ .

$$\begin{array}{l} 1 \text{ mole} = 21000 \text{ J} \\ \times \\ 0.2 \text{ moles} = x \end{array}$$

$$\underline{\underline{x = 4200 \text{ J}}}$$

(+) value means heat absorbed.

④ Since dissolution reaction absorbed heat, then the surrounding water must have released heat!

$$Q = -\Delta H_d$$

$$\underline{\underline{Q = -4200 \text{ J}}}$$

⑤ Determine temperature change ( $\Delta T$ )

$$Q = mc \Delta T$$

$$-4200 = 2000(4.18) \Delta T$$

$$\frac{-4200}{2000(4.18)} = \Delta T$$

$$\underline{-0.5^\circ\text{C} = \Delta T}$$

⑥ Determine final temperature ( $T_f$ )

$$\Delta T = T_f - T_i$$

$$-0.5 = T_f - 24$$

$$\underline{\underline{\underline{T_f = 23.5^\circ\text{C}}}}}$$
